Writing for the sciences
Section S

semester reflection

At the beginning of this semester, I did not believe that writing was important to science majors, I thought that this class was going to be like another science class that didn't involve science that much, like political science, etc.

By the end of the semester, I understood how important writing is for every single major, not only science. I also understood that writing a good paper will open many doors for me in the science industry, also because in the science industry you have to regularly write papers.

My perspective of science has definitely changed since I started this course, like I mentioned, I thought that writing has nothing to do with science but it still was very related to it, I also learned that there is a bunch of ways to represent statistics and numbers in words that are only seen in science papers. For me, science is now something very amazing that has a lot of free will in it. The way you can take various liquids and create a cure has always been fascinating to me since I was a kid, now that I'm older my view has not changed a all (in the making experiment part), but when it comes to the writing part it has definitely changed.

I will definitely take a lot out of this course, including how to look for good science sources, how to write good papers, how to create a hard draft, and how to edit the drafts to make the perfect paper. I am also very grateful that my professor took the time to teach me properly and that he was very nice to all of us.
